

**University of Pennsylvania  
Division of Biostatistics  
Subject Guide**

**BSTA 6700: Programming and Computation for Biomedical Data Science**

**Credit points:** 1.0  
**Semester:** Spring 2025  
**Time:** M/W 10:15-11:35am EST  
**Location:** 100 John Morgan Building

**Course Instructor:** Kristin A. Linn  
Assistant Professor of Biostatistics  
Email: [klinn@pennmedicine.upenn.edu](mailto:klinn@pennmedicine.upenn.edu)  
Office: Richards, D2 (in the basement)  
**Office hours: Wednesdays 12-1pm; or by appointment**  
**Location:** Richards, D2

**TA** Zach Qian  
Email: Zachary.Qian@pennmedicine.upenn.edu  
**Office hours: TBD; or by appointment**  
**Location:** TBD

**Pre-requisites:** BSTA 620, 621, and 651; or permission of instructor.

**Subject Aims:** The course will cover programming and computational fundamentals in Python and R. It will concentrate on computational tools that are useful for statistical research and computationally intensive analyses. The goal is for students to develop a knowledge base and skill set that includes a wide range of modern computational tools needed for statistical research and data science. Topics may include, but are not limited to:

1. Reproducible research and programming
2. Algorithms
3. Simulation
4. Computer storage and arithmetic
5. Numerical Integration
6. Optimization

**Course Materials:** All course materials will be available on Canvas. Canvas is assessable from the Penn library: <https://canvas.upenn.edu>

**Software:** A combination of R and Python will be used.

**Textbook:** None required.

**Breaks:** There will be **no class** on:  
February 26 (DBEI Research Day)  
March 10 and 12 (Spring Break)  
March 24 and 26 (ENAR conference)  
April 7 (UPenn's Annual Clinical Trials Conference)

**Assessment:** All assignment materials will be submitted on Canvas. Grades will be based on the following components:

**Problem sets: 60% (4 @15% each)**

**Final project: 40%**

Students are encouraged to discuss strategies for solving problem sets, but all submitted code should reflect each student's unique implementation. **Evidence of shared code will be penalized.**

**Late Policy:** Late assignments will receive a maximum of half credit. An assignment submitted 1 minute after the deadline will be considered late. Assignments more than 3 days late will not be graded and will receive no credit. **If you have a pre-existing commitment or special circumstance (e.g., conference travel, family emergency) please let me know as far in advance as possible so that we can make alternative arrangements for submitting your work.**

**Final Project:** PhD students will replicate and extend the results of a recently published Monte Carlo stimulation experiment. The final project will include an R package containing simulation code and a report written in .Rmd that fully reproduces the simulation experiment.

MS students will have the option to complete the simulation project described above or perform an applied analysis of a public data set in a Python notebook or Rmarkdown document.

Additional details about the final project requirements will be given later in the semester.

All project materials due on Canvas: May 9, 2025, by 11:59pm EST

## Use of Generative AI Tools

I encourage you to use foundation models such as ChatGPT, GitHub Copilot, etc., in combination with critical thinking skills to further your educational development. If you use these models to obtain quick solutions, you may be missing out on learning opportunities and potentially stifling your own creativity. Keep in mind large language models may produce incorrect statements and fake citations, and code generation models may produce incorrect outputs. **If you use materials produced by foundation models, you must cite them as you would any other reference materials.** It is also important to "show your work" to get full or partial credit, i.e., **document what prompts you used** to obtain your outputs.
